The development of this "suicide" mechanism has been intimately linked with the evolution of animals and may be highly relevant in regulating organ size in humans. Understanding the molecular basis of this process has been a longstanding challenge in the field. I am interested in how specific sequences in target genes are recognized by a gene product termed the caspase, an aspartyl-protease. The molecular basis of caspase action will be investigated by biochemical studies, and a novel method will be developed to determine its precise point of action in 82157476af
